Project Basic Information	
Project Name	Dare-IT QA Challenge portfolio
Name of product	"Panel Skautingowy" available here
Project Goal	Regression of application to the stage environment
Operating system & Browser	Windows 7, 64- bit, Chrome 107.0.5304.89
Author	Marta Sarnowska
Testing Duration	October 27th- November 16th
Kind of testing	Manual

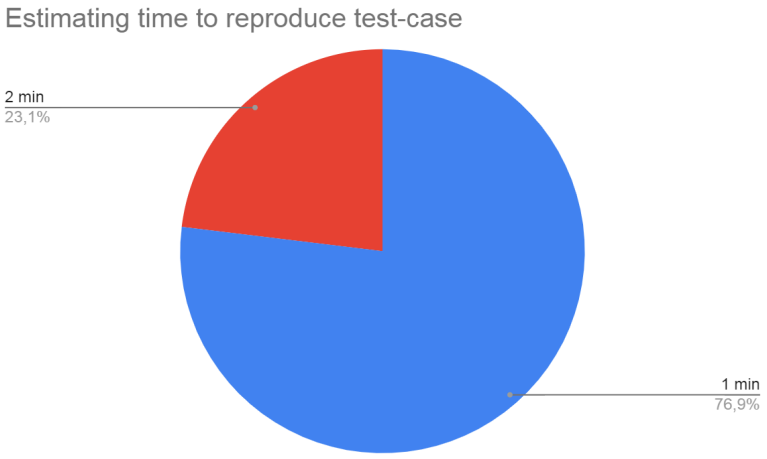

The implementation of the task I have started by conducting the exploration tests which help me to understand application performance and get to know as many functionalities as I can.

In the next step, test-cases have been planned, implemented and executed. They were based on user-stories (**23,1%**) and my own experience (**76,9%**).
The list of my test- cases are available here and here (26 test-cases).

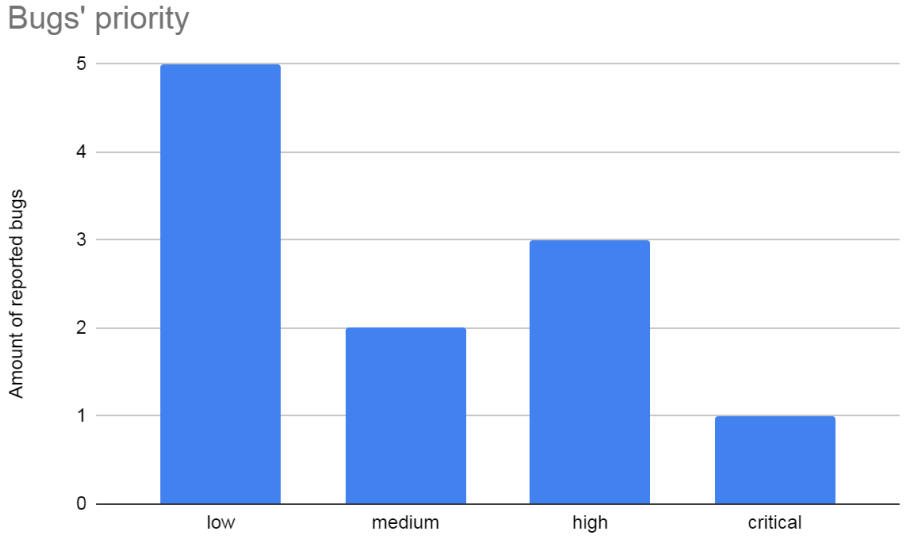

Almost half of planned test-cases have ended in failure which indicates that the application is very underdeveloped at this stage.

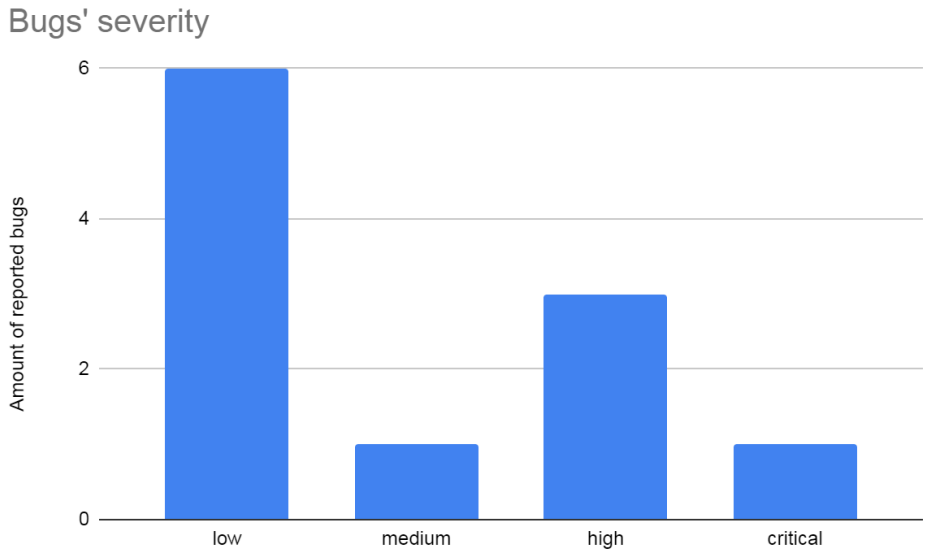

Below there is a chart showing the estimating time to reproduce my planned test-cases - most of them set up less than 2 minutes.

It should be noted that I have not got any specifications for this application so it is a risk that some of test-case can be not specific or can be exaggerated (especially validation bugs).
The list of reported bugs is here.
Below there is a collation of all of the reported bugs based on the priority and severity.

Noteworthy is a critical bug related to adding a new game to the player because it blocked one of the most important functionality in the app and also because of it one of the test-case had to be skipped.

To sum up:

- the access to application's specifications is essential to create a better test-plan, because this presented above has many uncertainties,
- there is a need to work in larger groups, especially with more experienced software testers and programmers, because the application has many deficiencies which have to be fixed,
- At this stage the application can't be released because of many not corrected bugs;
